Abstracts

The 7 major dyskinesia markets are expected to exhibit a CAGR of 3.14% during 2024-2034.

The dyskinesia market has been comprehensively analyzed in IMARC's new report titled "Dyskinesia Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Dyskinesia refers to a wide range of neurological diseases characterized by excessive and involuntary muscle movements that may be jerky, writhing, or tremor-like. It can affect various parts of the body, including the face, limbs, trunk, and even the vocal cords. The specific symptoms and severity of the illness can vary depending on the underlying cause. In some cases, dyskinesias may interfere with normal movements, causing difficulties with daily activities. Individuals suffering from this ailment may experience a sense of restlessness, facial grimacing, rapid blinking, waving of the arms or hands, difficulty breathing, abnormal postures, throat clearing, vocalizations, etc. The diagnosis of the condition is typically based on a patient's underlying symptoms, medical history, physical tests, and neurological examination. The healthcare provider may perform several imaging techniques, like magnetic resonance imaging (MRI) or computed tomography (CT) scans, that can help to visualize the structure of the brain and rule out other possible diseases. Furthermore, a blood workup is recommended to check for specific markers or assess organ function in patients.

The increasing cases of neurological conditions that cause gradual deterioration of nerve cells in the brain are primarily driving the dyskinesia market. In addition to this, the rising usage of recreational drugs, such as amphetamines and cocaine, which may disrupt the normal functioning of the basal ganglia, leading to movement abnormalities,

is also creating a positive outlook for the market. Moreover, the widespread adoption of cognitive-behavioral therapy, since it focuses on identifying and modifying maladaptive thoughts and behaviors in order to promote coping among patients, is further bolstering the market growth. Apart from this, the inflating application of botulinum toxin injections to improve motor control and discomfort by inhibiting the synthesis of acetylcholine, a neurotransmitter responsible for muscle contractions, is acting as another significant growth-inducing factor. Additionally, the emerging popularity of deep brain stimulation (DBS) procedures, which involve implanting electrodes into specific areas of the brain to deliver targeted electrical impulses that can reduce the severity and frequency of symptoms, is expected to drive the dyskinesia market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the dyskinesia market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for dyskinesia and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the dyskinesia market in any manner.
