## Abstracts

The European PVC Pipes market size reached 6.3 Million Tons in 2022. Looking forward, IMARC Group expects the market to reach 8.2 Million Tons by 2028, exhibiting a growth rate (CAGR) of 4.3% during 2023-2028.

Polyvinyl chloride (PVC) pipes are continuously replacing the conventional metal pipes owing to their durability, recyclability, low cost, light-weight and ease of installation. Additionally, PVC pipes are also used for electrification purposes due to their electrical and heat insulation. They can also withstand rigorous movements, bending and shaking in earthquake prone areas without damaging. Further, these pipes exhibit resistance to chemicals and high fluid pressure, making them suitable for water supply.

One of the primary factors catalysing the growth of the European PVC pipes market is growth in the construction sector. The construction sector in the European region is growing at a steady rate as the market has recovered after the economic downturn. Both public and private infrastructure and construction projects have resumed and are catalysing the demand for PVC pipes. In addition, there is a major drive in Europe towards sustainable transformation related to materials and systems used in the plumbing sector in the past few years. Copper and other metal pipes are being replaced by plastic piping systems. Moreover, focus on the reduction of operating costs have also boosted the plumbing sector, which has generated a great prospect for PVC pipes as they offer huge performance benefits over metal pipes. Strong economic growth in a number of Central and Eastern European countries and rising housing demand in the region is another major driver of the market.
