The 7 major gallbladder cancer markets reached a value of US\$ 51.6 Million in 2023. Looking forward, IMARC Group expects the 7MM to reach US\$ 66.8 Million by 2034, exhibiting a growth rate (CAGR) of 2.38% during 2024-2034.

The gallbladder cancer market has been comprehensively analyzed in IMARC's new report titled "Gallbladder Cancer Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Gallbladder cancer refers to an oncological disease that develops in the mucosal layer of the gallbladder, a pear-shaped organ located below the liver. The gallbladder is essential for concentrating and storing bile in the body, which is required for breaking down fats in the stomach and intestines. Individuals suffering from this condition may experience upper abdominal pain, yellowed skin and whites of the eyes, lumps in the abdomen, unexplained weight loss, nausea, vomiting, bloating, fever, weakness, loss of appetite, general malaise, etc. Gallbladder cancer is typically diagnosed through a combination of medical history, laboratory tests, and imaging studies. During a laboratory exam, the healthcare provider will closely measure the levels of the tumor marker, carcinoembryonic antigen, in the blood to look for potential signs of the ailment. Numerous other imaging tests, such as computed tomography scans, magnetic resonance imaging, abdominal ultrasounds, etc., are also utilized to determine the extent of the tumor and if it has spread to other regions of the body. Furthermore, a biopsy of the affected area is generally required to confirm a diagnosis of the disease.

The rising cases of genetic abnormalities that cause the cells to grow out of control and accumulate within the body to form a tumor are primarily driving the gallbladder cancer market. Additionally, the expanding geriatric population, who are more susceptible to

chronic inflammation, which can result in physiological changes affecting the functioning of organs, is also propelling the market growth. Besides this, the emerging popularity of external beam radiation therapy on account of its numerous benefits over systemic treatments, including local tumor control, reduced hospital stays and recovery time, a lower risk of developing side effects, etc., is acting as another significant growth-inducing factor. Furthermore, the inflating adoption of cholangiography for providing the exact location and extent of the tumor, which can help to monitor more precise surgical interventions in patients, is also bolstering the market growth. Apart from this, the escalating application of immunotherapeutic agents, involving pembrolizumab and nivolumab, for treating individuals with advanced disease conditions, since they strengthen the immune system's ability to discover and destroy cancerous cells, is expected to drive the gallbladder cancer market in the coming years.

IMARC Group's new report provides an exhaustive analysis of the gallbladder cancer market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for gallbladder cancer and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the gallbladder cancer market in any manner.
