Abstracts

The 7 major gestational diabetes markets are expected to exhibit a CAGR of 4.77% during 2024-2034.

The gestational diabetes market has been comprehensively analyzed in IMARC's new report titled "Gestational Diabetes Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Gestational diabetes refers to a type of diabetes that can occur in pregnant women. It develops when the body is unable to produce enough insulin to control the increased demand for glucose over that period. This results in high levels of glucose in the blood, which can lead to various complications for both the mother and the baby. Moreover, a pregnant woman with this ailment is at a higher risk of developing Type 2 diabetes later in life. Some of the common symptoms of gestational diabetes include frequent urination, increased thirst, blurred eyesight, genital itching, excessive tiredness, etc. The diagnosis of this ailment relies on a screening test during the second trimester or between 24 and 28 weeks of pregnancy. The healthcare provider may perform an initial glucose challenge test, followed by glucose tolerance testing to measure the blood sugar level and confirm a diagnosis among patients.

The increasing cases of hormonal changes during pregnancy that make the body less capable of processing blood sugar or utilizing insulin are primarily driving the gestational diabetes market. In addition to this, the rising incidences of multiple associated risk factors, such as being overweight, having a sedentary lifestyle, family history of diabetes, heart disease, etc., are also bolstering the market growth. Furthermore, the inflating utilization of effective anti-diabetic drugs, involving glibenclamide and metformin, to lower glucose concentrations in the blood and treat the underlying

symptoms in patients, is acting as another significant growth-inducing factor. Apart from this, the escalating application of non-pharmacological interventions, like lifestyle modifications, which include eating a healthy and balanced diet, exercising regularly, maintaining optimum body weight, etc., is further creating a positive outlook for the market. Additionally, the growing popularity of insulin pens over conventional syringe therapies to treat this condition since they are more convenient to use, provide greater dose accuracy, stabilize blood sugar, and enhance patient outcomes is expected to drive the gestational diabetes market in the coming years.

IMARC Group's new report provides an exhaustive analysis of the gestational diabetes market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for gestational diabetes and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the gestational diabetes market in any manner.
