Abstracts

The 7 major hematuria markets are expected to exhibit a CAGR of 2.23% during 2024-2034.

The hematuria market has been comprehensively analyzed in IMARC's new report titled "Hematuria Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Hematuria is a medical term that refers to the presence of red blood cells in the urine. The blood may come from various parts of the urinary tract, like the bladder, ureters, kidneys, or urethra. This condition can mainly be categorized into two types: gross and microscopic. In gross hematuria, blood in the urine is visible to the naked eye, giving the urine a reddish or pinkish color, whereas, in microscopic hematuria, small amounts of blood are detectable only through a microscope during a urine test. Individuals suffering from the ailment might experience a sense of urgency to urinate, lower abdominal pain or discomfort, increased frequency of urination, blood clots, swelling in the legs or feet, etc. The diagnosis of hematuria is typically based on the patient's clinical features, medical history, urinalysis, and several other laboratory tests. A healthcare provider may also perform computed tomography scans and magnetic resonance imaging to visualize detailed cross-sectional pictures of the urinary tract. Depending on the suspected causative factor of the disease, various blood workups, such as kidney function tests, coagulation profiles, and inflammatory markers, may be conducted to confirm the diagnosis among patients.

The increasing prevalence of urinary tract infections that can cause inflammation and irritation, leading to blood in the urine, is primarily driving the hematuria market. In addition to this, the rising cases of blood disorders, in which the body's normal clotting mechanism becomes impaired, resulting in easy bruising and excessive bleeding, are

also creating a positive outlook for the market. Moreover, the widespread adoption of shock wave lithotripsy procedures to alleviate the presence of blood in the urine by removing or reducing the size of the kidney stones that might be causing the underlying condition, is further bolstering the market growth. Apart from this, the inflating application of immunosuppressive drugs on account of their numerous advantages, such as controlling autoimmune processes, minimizing renal inflammation, and preventing disease progression, is acting as another significant growth-inducing factor. Additionally, the emerging popularity of cystoscopy, which allows direct visualization of the bladder lining, thereby helping to identify the source of bleeding accurately, is expected to drive the hematuria market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the hematuria market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for hematuria and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the hematuria market in any manner.
