Abstracts

The hepatic cirrhosis market has been comprehensively analyzed in IMARC's new report titled "Hepatic Cirrhosis Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Hepatic cirrhosis is a chronic liver condition characterized by the irreversible scarring of liver tissue, resulting in impaired liver function. This scarring disrupts the normal structure of the liver, replacing healthy tissue with fibrous bands. Common causes include chronic alcohol abuse, viral hepatitis, and fatty liver disease. As the ailment progresses, symptoms may manifest, including fatigue, weakness, abdominal pain, and unintended weight loss. Additionally, individuals suffering from this illness may experience complications such as ascites (fluid buildup in the abdomen), jaundice, and easy bruising or bleeding due to decreased production of clotting factors. Diagnosing hepatic cirrhosis often involves a combination of medical history review, physical examination, and diagnostic tests such as liver function tests, imaging studies (like ultrasound or CT scans), and sometimes a liver biopsy to assess the extent of liver damage.

The escalating incidence of somatic mutations, which contribute to the progressive overgrowth of fibrous tissue in the liver, disrupting its normal function, is primarily driving the hepatic cirrhosis market. In addition to this, the inflating utilization of effective medications, such as antifibrotic agents, diuretics, and beta-blockers, aimed at managing the condition and averting further hepatic damage is creating a positive outlook for the market. Moreover, the widespread adoption of physical and occupational therapies is also bolstering the market growth. These therapeutic interventions not only bolster muscular strength but also enhance coordination and improve gross motor skills in individuals suffering from the ailment. Apart from this, the rising usage of advanced procedures, including transjugular intrahepatic portosystemic shunt (TIPS) and liver

transplantation, which aim to alleviate symptoms, reduce complications, and enhance the overall quality of life is acting as another significant growth-inducing factor. Additionally, the emerging popularity of gene therapy that involves the introduction of functional genetic material to rectify or replace mutated genes responsible for the underlying condition is expected to drive the hepatic cirrhosis market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the hepatic cirrhosis market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for hepatic cirrhosis and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the hepatic cirrhosis market in any manner.
