Abstracts

The 7 major hepatic insufficiency/liver failure markets are expected to exhibit a CAGR of 3.79% during 2024-2034.

The hepatic insufficiency/liver failure market has been comprehensively analyzed in IMARC's new report titled "Hepatic Insufficiency/Liver Failure Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Hepatic insufficiency, often known as liver failure, is a potentially fatal condition defined by a significant deterioration in liver function. It is generally caused by liver abnormalities, which inhibit normal liver functioning in life-sustaining activities, making it difficult or impossible for the liver to operate. There are two different forms of liver failure. The first is acute liver failure, which develops rapidly due to situations such as the consumption of toxic compounds. The second form is chronic liver failure, which worsens liver function over a lengthy period of time, usually months to years. The early symptoms of this indication are identical to those of any other liver illness, including nausea, lack of appetite, exhaustion, and bowel troubles. However, as the condition progresses, other symptoms may arise. These symptoms usually involve fluid retention in the abdomen, often known as ascites, nausea that may escalate into vomiting containing blood due to blood vessel hemorrhage, itchiness, gallstones, jaundice, loss of musculature and body weight, and kidney damage. The patient could also experience mental disorientation as a result of the accumulation of toxicants in the blood. The first step in determining liver failure is to learn about the patient's medical history. The physician subsequently conducts a clinical exam on the patient. Following the examination, multiple blood tests are carried out to establish whether the liver is functioning normally, and a microscopic examination is performed to diagnose the exact type of liver failure. In many circumstances, the physician will request the patient undergo confirmatory tests such as

a CT scan, endoscopy, MRI, and ultrasound to validate the liver failure.

The increasing incidences of autoimmune illnesses and viral infections, such as hepatitis, which can cause significant liver damage, are primarily driving the hepatic insufficiency/liver failure market. In addition to this, the rising prevalence of various associated risk factors, including excessive alcohol consumption, high doses of drugs like acetaminophen or paracetamol, advanced fatty liver, etc., are further bolstering the market growth. Moreover, the expanding geriatric population, who are more susceptible to numerous chronic ailments, such as liver disease, is also creating a positive outlook for the market. Besides this, several key players are making extensive investments in developing highly sensitive and rapid tests to detect liver diseases in specific populations, including pregnant women and HIV-positive patients. This, in turn, is further acting as a significant growth-inducing factor. Additionally, the increasing utilization of liver dialysis in the later stages of the disease for removing the toxins from the bloodstream, which the liver is unable to perform, is also propelling the global market. Apart from this, various biotechnological advancements, such as the introduction of the bioartificial liver, which utilizes regenerated cells to replace liver functions and is widely used for acute liver failure patients, are expected to drive the hepatic insufficiency/liver failure market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the hepatic insufficiency/liver failure market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for hepatic insufficiency/liver failure and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the hepatic insufficiency/liver failure market in any manner.
