Abstracts

The 7 major kyphoscoliosis markets are expected to exhibit a CAGR of 2.74% during 2024-2034.

The kyphoscoliosis market has been comprehensively analyzed in IMARC's new report titled "Kyphoscoliosis Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Kyphoscoliosis is a complex spinal disorder characterized by an abnormal curvature of the spine in both the lateral and frontal planes. It involves a combination of kyphosis, a forward rounding of the upper back, and scoliosis, a sideways curvature. This ailment may lead to a variety of physical and functional issues due to the altered shape of the spine. The symptoms of the illness can vary widely and may include back pain, stiffness, muscle imbalance, and breathing difficulties. As the curvature progresses, individuals suffering from the disorder may also experience visible deformities in their posture, such as an uneven waist or shoulders, along with reduced mobility and discomfort during everyday activities. Diagnosing kyphoscoliosis typically involves a thorough physical examination, including a visual assessment of the spine's alignment and range of motion. Imaging techniques like X-rays, CT scans, MRIs, etc., are also utilized to accurately measure the degree of curvature and determine its impact on surrounding structures.

The increasing cases of genetic mutations and congenital factors, which lead to abnormal vertebral development and compromised musculature support, are primarily driving the kyphoscoliosis market. In addition to this, the inflating utilization of effective therapeutic interventions, including pain relievers, muscle relaxants, and brace treatments, that offer relief from symptoms and halt the progression of spinal deformity

is also creating a positive outlook for the market. Moreover, the widespread adoption of physical and rehabilitation therapies, on account of their several advantages like improving posture, strengthening back muscles, and enhancing spinal alignment in individuals suffering from the illness, is further bolstering the market growth. Apart from this, the rising usage of surgical interventions, especially spinal fusion procedures, since they serve as a revolutionary approach to ensure long-term spinal stabilization and curvature correction in patients, is acting as another significant growth-inducing factor. Additionally, the emerging popularity of non-invasive therapies like chiropractic adjustments and acupuncture for alleviating pain and promoting spinal health without causing potential side effects is also augmenting the market growth. Furthermore, the escalating application of regenerative medicine, encompassing stem cell therapy and tissue engineering, which help to address the underlying structural problems associated with the disorder, is expected to drive the kyphoscoliosis market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the kyphoscoliosis market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for kyphoscoliosis and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the kyphoscoliosis market in any manner.
