## Abstracts

The global laminated veneer lumber market size reached US\$ 5.4 Billion in 2023. Looking forward, IMARC Group expects the market to reach US\$ 6.7 Billion by 2032, exhibiting a growth rate (CAGR) of 2.7% during 2024-2032.

Laminated veneer lumber (LVL) represents one of the widely used engineered wood products, which is made using sliced and peeled thin wood veneers. It is a lightweight construction material that finds application in public buildings, industrial warehouses, product components, large-prefabricated buildings, and customized wooden houses. This can be accredited to its durability, uniformity, high strength, and dimensional precision. Besides this, it is also used for structural framing in commercial and residential construction, which includes joists, beams, lintels, purlins, concrete formwork, truss chords, and scaffold boards.

### Laminated Veneer Lumber Market Trends:

Due to inflating income levels and the growing global population, there is a rise in the uptake of new construction projects in the residential, commercial, and infrastructural sectors. This represents one of the key factors strengthening the growth of the market. Moreover, structures built with LVL require a short construction period than traditional materials, such as concrete and bricks, which is positively influencing the overall sales. This can be attributed to its easy and faster installation and reduced time of shrinkage. Apart from this, LVL is made with heavy-duty glue that adds stability and strength and offers advantages such as waterproofing and resistance to rot, insects, and mold, which

is creating a positive market outlook. Furthermore, as the production process of LVL is environment friendly, governments of numerous countries are encouraging end users to shift towards these wood panels. The ongoing research undertaken by leading players to explore the feasibility of manufacturing LVL using different materials is also fueling the market growth.
