Abstracts

The 7 major lip and oral cavity cancer markets are expected to exhibit a CAGR of 3.56% during 2024-2034.

The lip and oral cavity cancer market has been comprehensively analyzed in IMARC's new report titled "Lip and Oral Cavity Cancer Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Lip and oral cavity cancer refers to the development of malignant tumors in the tissues of the lips or the oral cavity, which includes the mouth, tongue, gums, and the lining of the cheeks. It typically starts as a small, painless white or red patch or an ulcer in the mouth that does not heal. The symptoms of the ailment include a persistent sore throat, discomfort, a lump or thickening, trouble swallowing or chewing, changes in speech, numbness, loose teeth, bad breath, bleeding, coughing, enlarged neck lymph nodes, etc. The diagnosis of this illness is based on a review of the patient's medical history, clinical features, and physical examination. Various imaging tests, like computed tomography (CT) scan, positron emission tomography (PET) scan, magnetic resonance imaging (MRI), etc., may be utilized to determine the severity of the tumor and if it has spread to other parts of the body. The healthcare provider will additionally perform an endoscopy or biopsy of lymph nodes to confirm the diagnosis among individuals suffering from the condition.

The rising prevalence of tobacco consumption in any form, including smoking cigarettes, cigars, pipes, etc., that can damage the cells or tissues in the mouth is primarily driving the lip and oral cavity cancer market. In addition to this, the increasing incidence of poor dental hygiene, which leads to the accumulation of bacteria and causes chronic inflammation in individuals, is also creating a positive outlook for the market. Moreover, the widespread adoption of brachytherapy, since it involves placing

radioactive material directly into or near the tumor site to deliver targeted radiation, is further bolstering the market growth. Apart from this, the inflating application of reconstructive surgeries, which include techniques, such as skin grafts or flaps to restore the appearance and function of the lip and oral cavity, is acting as another significant growth-inducing factor. Additionally, the emerging popularity of targeted drug therapies that are designed to block the activity of genetic mutations, thereby preventing disease spread or promoting cancer cell death, is expected to drive the lip and oral cavity cancer market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the lip and oral cavity cancer market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for lip and oral cavity cancer and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the lip and oral cavity cancer market in any manner.
