Abstracts

The 7 major lung adenocarcinoma markets reached a value of US\$ 14.2 Billion in 2023. Looking forward, IMARC Group expects the 7MM to reach US\$ 27.5 Billion by 2034, exhibiting a growth rate (CAGR) of 6.23% during 2024-2034.

The lung adenocarcinoma market has been comprehensively analyzed in IMARC's new report titled "Lung Adenocarcinoma Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Lung adenocarcinoma refers to a type of non-small cell lung cancer that originates in the glandular cells lining the air sacs (alveoli) in the lungs. This disease usually tends to grow slowly, but over time it often spreads to other parts of the body, such as the lymph nodes, liver, bones, or brain. The symptoms of lung adenocarcinoma can vary from person to person, and some patients may not develop any indications in the early stages. However, as the tumor grows and spreads, individuals suffering from the illness may experience persistent coughing, fatigue, shortness of breath, chest pain, unexplained weight loss, coughing up blood, lack of appetite, hoarseness or voice changes, recurrent respiratory infections, etc. The diagnosis of this condition typically requires a combination of medical history evaluation, characteristic findings, and a physical examination. Several diagnostic techniques, such as X-rays, positron emission tomography scans, magnetic resonance imaging, etc., may be adopted to visualize the lungs and identify any abnormal growths or masses. In some cases, a tissue biopsy is also performed to confirm the diagnosis among patients.

The increasing incidence of smoking tobacco, including cigarettes, pipes, and cigars, which can damage the lung tissue and create an environment that promotes the growth of cancerous cells, is primarily driving the lung adenocarcinoma market. In addition to

this, the rising cases of germline variations in genes that are involved in DNA repair mechanisms and tumor suppression are also creating a positive outlook for the market. Moreover, the widespread adoption of minimally invasive radiofrequency ablation technique, which uses thermal energy to destroy cancerous cells and causes less trauma to the surrounding healthy tissue as compared to open surgeries, is further bolstering the market growth. Apart from this, the inflating application of targeted therapies, like tyrosine kinase inhibitors, owing to their various associated advantages, such as improved efficacy, long-term disease control, increased treatment outcomes, etc., is acting as another significant growth-inducing factor. Additionally, the emerging popularity of gene therapy, which aims to treat the ailment by modifying or replacing defective genetic material with functional ones, is expected to drive the lung adenocarcinoma market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the lung adenocarcinoma market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for lung adenocarcinoma and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the lung adenocarcinoma market in any manner.
