The global MEMS gyroscope market size reached US\$ 2.0 Billion in 2023. Looking forward, IMARC Group expects the market to reach US\$ 3.4 Billion by 2032, exhibiting a growth rate (CAGR) of 5.8% during 2024-2032.

The micro-electro-mechanical system, or MEMS gyroscope, is a mechanical device used for measuring angular velocity and navigation. It operates on the principle of conservation of momentum and consists of a free-rotating disk mounted onto a spinning axis in the center of a larger and more stable wheel. The device is utilized in consumer electronics, automotive airbag systems, gaming consoles, virtual reality (VR) and robotics. In digital cameras, it aids in capturing high-resolution images with intricate details. Apart from this, the integration of gyroscopes with the MEMS technology has enabled the development of miniaturized sensors, which use microscopic vibrating mechanisms to detect changes in the orientation and velocity.

The growing electronics industry across the globe is among the key factors driving the market growth. Furthermore, the increasing utilization of smart and portable devices, such as smartphones, tablets and laptops, that use MEMS gyroscope for precise motion-sensing is also acting as a growth-inducing factor. Additionally, owing to various

favorable properties, such as low-weight, cost-efficiency, compact size and minimal energy consumption, the device is extensively used in inertial navigation of automobiles, sailing boats, aircrafts, consumer electronic products, military missiles and satellites. Moreover, extensive research and development (R&D) to improve the stability of MEMS gyroscope for finding applications in targeting and pointing instruments is also impacting the market growth positively. Other factors, including the growing adoption of wearable devices and the increasing automation in industries and residential complexes, are projected to drive the market further.
