## Abstracts

The 7 major mydriasis markets are expected to exhibit a CAGR of 6.14% during 2024-2034.

The mydriasis market has been comprehensively analyzed in IMARC's new report titled "Mydriasis Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Mydriasis refers to a medical disorder in which the pupil of the eye remains abnormally dilated and fails to constrict properly in response to changes in lighting conditions or other stimuli. This can result in increased sensitivity to light, glare, and difficulties with vision, especially in a bright environment. Additionally, individuals suffering from mydriasis may experience blurred vision or problems with focusing, particularly when transitioning between different lighting conditions. The presence of other accompanying indications will depend on the underlying cause of mydriasis, which may include symptoms related to medication side effects, eye diseases, neurological disorders, or systemic conditions. The diagnostic process generally begins with a thorough medical history and physical examination, including an assessment of the eyes, neurological functioning, as well as the evaluation of any associated symptoms. Numerous specialized diagnostic procedures may be conducted, such as pupillometry to objectively measure pupillary responses, imaging studies like MRI or CT scans to assess structural abnormalities, and laboratory tests to investigate systemic conditions or drug-related causes.

The rising cases of several eye disorders, such as uveitis, iritis, glaucoma, ocular trauma, etc., that affect the normal functioning of the iris muscles are primarily driving the mydriasis market. Furthermore, the widespread adoption of alpha-adrenergic agonist eye drops, including apraclonidine or brimonidine, to constrict the dilated pupil

and reduce light sensitivity is acting as another significant growth-inducing factor. Additionally, the inflating utilization of pupil constriction exercises, which involve performing specific eye exercises that help in stimulating the muscles responsible for controlling the size of the pupil, is also augmenting the market growth. Moreover, the escalating demand for surgical procedures to correct anatomical issues, repair damaged structures, as well as alleviate underlying neurological problems that contribute to mydriasis is creating a positive outlook for the market. Apart from this, the ongoing advancements in imaging technologies, such as the introduction of high-resolution digital imaging and anterior segment optical coherence tomography, which have improved the visualization of the anterior segment of the eye, including the iris and pupil, are expected to drive the mydriasis market in the coming years.

IMARC Group's new report provides an exhaustive analysis of the mydriasis market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for mydriasis and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the mydriasis market in any manner.
