Abstracts

The 7 major myofascial pain syndromes markets are expected to exhibit a CAGR of 2.69% during 2024-2034.

The myofascial pain syndromes market has been comprehensively analyzed in IMARC's new report titled "Myofascial Pain Syndromes Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Myofascial pain syndromes refer to a group of conditions characterized by chronic pain in the musculoskeletal system, specifically in the muscles and their surrounding connective tissues called fascia. The pain is typically localized to certain trigger points, which are sensitive areas within the muscle. The symptoms of these syndromes may vary from person to person but commonly include persistent, deep, and aching pain in the affected regions, restricted range of motion, a sensation of weakness, poor sleep quality, fatigue, decreased energy levels, etc. Individuals suffering from the condition may also experience emotional distress, such as feelings of frustration, anxiety, depression, etc. The diagnosis of myofascial pain syndromes typically involves a thorough combination of medical history, physical examination, and laboratory tests. Electromyography is also recommended to measure the electrical activity of muscles and detect any abnormalities associated with the disease. The healthcare provider may further perform various diagnostic procedures, like ultrasound or magnetic resonance imaging, to visualize the muscle tissue, identify trigger points, and confirm the presence of tender nodules in patients.

The increasing cases of muscle imbalances due to several factors, such as muscle weakness, tightness, altered movement patterns, etc., leading to the development of trigger points, are primarily driving the myofascial pain syndromes market. In addition to

this, the inflating application of over-the-counter pain relievers, including ibuprofen and acetaminophen, which can manage pain and improve treatment outcomes, is also creating a positive outlook for the market. Moreover, the widespread adoption of transcutaneous electrical nerve stimulation (TENS) techniques, since they use a small device that transmits electrical currents to the muscles, helping to minimize disease symptoms and muscle tension, is further bolstering the market growth. Apart from this, the rising demand for stress management procedures, owing to their numerous benefits, like promoting better sleep quality, enhancing pain coping mechanisms, lowering inflammation, etc., is acting as another significant growth-inducing factor. Additionally, the emerging popularity of trigger point injections, which involve injecting a mixture of anesthetics and steroids into sensitive areas to improve flexibility and functional abilities, is expected to drive the myofascial pain syndromes market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the myofascial pain syndromes market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for myofascial pain syndromes and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the myofascial pain syndromes market in any manner.
