## **Abstracts**

The global neurodegenerative disease treatment market size reached US\$ 74.7 Billion in 2023. Looking forward, IMARC Group expects the market to reach US\$ 114.6 Billion by 2032, exhibiting a growth rate (CAGR) of 4.7% during 2024-2032.

Neurodegenerative diseases refer to a group of brain disorders that lead to progressive degeneration of the structure and function of neurons in the central nervous system (CNS) or peripheral nervous system (PNS). Presently, several medications are available to reduce physical or mental symptoms and improve the quality of patients' life. Moreover, researchers are focusing on developing molecular diagnostics, especially biomarkers and imaging spectroscopy, to detect and diagnose neurodegenerative diseases at an early stage and prevent their progression.

The growing prevalence of tumors and stroke on account of excessive alcohol consumption, in confluence with the rising geriatric population, represents one of the

major factors increasing the risk of developing neurodegenerative diseases. This is further escalating the need for molecular diagnostic techniques for early diagnosis of neurodegenerative disorders, including Alzheimer's disease, Parkinson's disease, Huntington's disease and amyotrophic lateral sclerosis. Apart from this, researchers are combining neuropathological methods with molecular biology techniques to understand the classification of these diseases effectively. They are also developing minimally invasive (MI) screening tests for different types of neurodegenerative diseases. Furthermore, governing agencies of numerous countries, along with non-governmental organizations (NGOs), are supporting various health education campaigns to generate awareness about the risk factors of neurodegenerative diseases. Other factors, such as increasing access to healthcare facilities on account of improving infrastructure and inflating disposable incomes, are anticipated to drive the growth of the market in the coming years.
