Abstracts

The 7 major neurofibrosarcoma markets are expected to exhibit a CAGR of 9.6% during 2024-2034.

The neurofibrosarcoma market has been comprehensively analyzed in IMARC's new report titled "Neurofibrosarcoma Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Neurofibrosarcoma, also known as malignant peripheral nerve sheath tumor (MPNST), is a rare and aggressive cancer that arises from the cells that form the protective covering of the peripheral nerves. These tumors can occur anywhere in the body but are mostly found in the limb, torso, head, and neck regions. The symptoms of neurofibrosarcoma depend on the location of the tumor and can include painless swelling or apparent lump, limping or soreness due to compressed nerves or muscles, numbness, weakness, loss of function in the affected area, etc. The diagnosis of this illness is based on a review of the patient's medical history, clinical features, blood tests, and comprehensive physical examination. The medical professional may perform a biopsy to assess whether the ailment is MPNST by extracting a sample from the diseased site. Numerous other diagnostic procedures, including magnetic resonance imaging (MRI), positron emission tomography (PET), computerized tomography (CT), etc., are also utilized to indicate the size and location of the tumor.

The increasing cases of inherited disorders causing DNA abnormalities in the cells lined around a nerve are primarily driving the neurofibrosarcoma market. In addition to this, the rising incidence of various associated risk factors, such as pre-existing neurofibromas, previous radiation exposure (therapeutic or environmental), family history, etc., is further creating a positive outlook for the market. Moreover, the

widespread utilization of ultra-low-pass whole genome sequencing for an adequate diagnosis of the disease with accurate identification of genetic variation and minimum measurement errors is also bolstering the market growth. Additionally, several healthcare companies are focusing on developing novel medications based on a better understanding of the genetics and molecular biology of soft tissue sarcomas. This, in turn, is acting as a significant growth-inducing factor. Furthermore, the inflating adoption of chemotherapy regimens, including doxorubicin, dactinomycin, cyclophosphamide, vincristine, etc., to treat unresectable and metastatic tumors is also catalyzing the market growth. Besides this, the ongoing developments in oncolytic virus vaccine therapy, which can destroy tumor cells through direct lytic activity of the virus life cycle or activating the innate immune response against cancer cells, are expected to drive the neurofibrosarcoma market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the neurofibrosarcoma market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for neurofibrosarcoma and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the neurofibrosarcoma market in any manner.
