The North America plywood market size reached 15.4 Million Cubic Meters in 2023. Looking forward, IMARC Group expects the market to reach 19.9 Million Cubic Meters by 2032, exhibiting a growth rate (CAGR) of 2.8% during 2024-2032.

Plywood is an engineered wood product made from three or more thin sheets of wood also known as 'plies'. These plies are glued together to form a thicker, flat sheet to form plywood. Due to the way the direction of each layer's grain is alternated in relation to adjacent layers, plywood becomes considerably stronger than some other wood-based sheet products, such as medium density fiberboard (MDF). It is also an economical, factory-produced sheet of wood with precise dimensions that does not warp or crack with changes in atmospheric moisture. These properties make plywood a versatile material with a huge range of applications ranging from wall and floor covering to molds for concrete structures, designer furniture to packaging.

North America plywood market is currently being driven by several factors. Based on the versatility, dimension stability, strength, stiffness and durability of plywood, it is employed for various structural and constructional purposes. It is used in concrete shuttering, boat-making, light partitions and external walls, flooring systems etc. Apart from this, an increasing number of residential and commercial spaces has also driven its demand in the region. Moreover, recent technological advancements have resulted in the introduction of new plywood variants with improved features, such as flexible plywood. In addition to this, plywood exhibits excellent resistance to a wide range of chemicals, making it suitable for industrial applications, thereby, catalyzing the market growth.
