Market Overview:

The North America precision agriculture market size reached US\$ 3.8 Billion in 2022. Looking forward, IMARC Group expects the market to reach US\$ 7.5 Billion by 2028, exhibiting a growth rate (CAGR) of 11.8% during 2023-2028.

Precision agriculture, also known as satellite agriculture or site-specific crop management (SSCM), is one of the most popular innovations witnessed by modern farming. It is the concept of managing accurate variabilities within a field to grow more food with less agricultural inputs while reducing the overall production cost. Precision agriculture relies upon specialized equipment, software and IT services to offer real-time data about the condition of the soil, ambient air and crops as well as other important information, such as labor costs, availability of equipment and local weather predictions. The retrieved data is used by farmers to know about the precise planting times, crop rotation and harvesting time. It also helps farmers in reducing the usage of water, pesticides, herbicides and fertilizers, thereby, making the technique cost-effective.

North America precision agriculture market is currently being driven by several factors. Being an urbanized region, the farmers in the region are increasingly relying on smartphones and other intelligent mediums to remain updated about the latest development in the agricultural sector. Moreover, through precision agriculture, farmers can easily determine the peak conditions required for plant growth by placing sensors throughout the place. These sensors are connected to digital applications and record rainfall, soil conditions in different areas, thereby helping the farmers to maximize their benefits. Apart from this, the precision agriculture techniques enable its users to

visualize production levels, soil moisture, and sunlight intensity in real-time and remotely accelerate the decision-making process. The data collected from these techniques enable agronomists to properly analyze the production quality and result in better correlation to treatments. These analyses are further used to educate farmers about the processes that are to be used for production, thereby improving the quality of the final product.
