The global NoSQL market size reached US\$ 7.3 Billion in 2022. Looking forward, IMARC Group expects the market to reach US\$ 35.7 Billion by 2028, exhibiting a growth rate (CAGR) of 29.92% during 2023-2028.

NoSQL, non-SQL or not-only-SQL, is a non-relational database (NRDB) that provides a mechanism for storing and retrieving data. It is called not-only-SQL as it can support SQL, along with non-tabular, semi-structured, polymorphic, structured and unstructured data. A NoSQL database is constructed for particular data models and includes flexible schemas that enable programmers to build and manage modern applications. Some of the common types of NoSQL include document, key-value, column and graph databases. It can be utilized in various situations, such as when vast amounts of data are required to be retrieved and stored; when there is no need for constraints and joint support at the database level; and when data is dynamic and unstructured.

NoSQL Market Trends:

The exponential growth in user-created content, supported by factors such as the rising influence of social media, easy access to smartphones and increasing internet penetration, has led to the generation of big datasets. As this data is generally sparse and unstructured, it has created a significant demand for NoSQL database systems for data management and analysis. Besides this, the integration of NoSQL systems into the Industry 4.0 landscape has led to the possibility of high scalability, lower cost, schema flexibility and distributed computing. Moreover, non-relational databases are being increasingly used in the financial sector to integrate data in a better and faster way, while incurring significantly lesser costs. Other advantages offered by NoSQL over SQL-based systems, such as easy scalability due to horizontal scaling and high availability of data, which can replicate itself in case of any failure, are further driving the market

growth.
