The global pharmaceutical filtration market size reached US\$ 11.2 Billion in 2022. Looking forward, IMARC Group expects the market to reach US\$ 35.7 Billion by 2028, exhibiting a growth rate (CAGR) of 21.31% during 2022-2028.

Pharmaceutical filtration refers to the process of separating solid particulate matter from fluids and gases using a porous medium. It can be performed using different methods depending on the application and chemical solution. For instance, ultrafiltration (UF) is a pressure-driven barrier that suspends pathogens and generates a high purity level in products. It is widely utilized in the separation, concentration, and purification of specific macromolecules and the production of vaccines, plasma, and serums. Moreover, cross-flow filtration is recently developed for eliminating total dissolved solids (TDS) in water.

Pharmaceutical Filtration Market Trends:

A considerable rise in the prevalence of chronic diseases has escalated the demand for generic medicines worldwide. This, along with stringent regulations for quality control of drugs, represents one of the key factors impelling the growth of the market. Moreover, the rising number of drug launches is positively influencing the adoption of pharmaceutical filtration methods to remove potential pathogens during the manufacturing processes. Technological advancements in the production of large molecules and biologics are also bolstering the market growth. Apart from this, the rising demand for advanced therapeutic drugs and increasing investments in research and development (R&D) projects are other factors contributing to market growth. Furthermore, the leading companies are focusing on collaborations, partnerships and merger and acquisitions (M&A) activities. This will assist these companies in developing innovative products that can be used across various applications, such as bioburden

testing, virus inactivation, and buffer preparation.
