Abstracts

The 7 major pituitary disorders markets are expected to exhibit a CAGR of 6.32% during 2024-2034.

The pituitary disorders market has been comprehensively analyzed in IMARC's new report titled "Pituitary Disorders Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Pituitary disorders refer to medical conditions that affect the pituitary gland, a small organ situated at the base of the brain that produces and regulates several important hormones. This gland plays a crucial role in controlling various bodily processes, including growth, metabolism, reproduction, function of other endocrine glands, etc. When pituitary disorders occur, they can disrupt the normal production and regulation of hormones, leading to a range of symptoms and potential complications, like visual disturbances or growth abnormalities. The common indications of these illnesses include persistent or severe headaches, fatigue, weakness, unexplained changes in weight, increased thirst and urination, alterations in appetite, sexual dysfunction, irregular or absent menstrual periods in women, infertility, reduced libido, etc. The diagnosis of the disorders involves a combination of medical history evaluation, clinical feature review, and physical examination. Numerous imaging techniques, like magnetic resonance imaging (MRI) or computed tomography (CT) scans, are recommended to visualize the pituitary gland's structure and identify any abnormalities, such as tumors or cysts. Furthermore, genetic testing may be performed to determine the underlying causes of the indications.

The rising cases of benign tumors, which can impair the production and release of hormones due to the compression of normal tissues, are primarily driving the pituitary disorders market. In addition to this, the increasing incidence of head injuries or trauma

that can damage the pituitary gland and disrupt its normal function is creating a positive outlook for the market. Moreover, the widespread adoption of hormone replacement therapy to alleviate symptoms associated with hormone deficiencies as well as promote muscle strength, energy, and bone health is further bolstering the market growth. Apart from this, the inflating application of transsphenoidal procedures, since they involve accessing the pituitary gland through the nasal passage or a small incision in the upper lip, thereby providing a minimally invasive alternative to traditional open surgery, is acting as another significant growth-inducing factor. Additionally, the emerging popularity of targeted therapies that are designed to specifically act on the underlying molecular pathways or genetic mutations responsible for the development and progression of the ailments is expected to drive the pituitary disorders market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the pituitary disorders market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for pituitary disorders and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the pituitary disorders market in any manner.
