Abstracts

The 7 major psychomotor agitation markets are expected to exhibit a CAGR of 1.92% during 2024-2034.

The psychomotor agitation market has been comprehensively analyzed in IMARC's new report titled "Psychomotor Agitation Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Psychomotor agitation refers to a set of symptoms characterized by excessive, purposeless physical activity, often accompanied by feelings of restlessness, tension, and irritability. It is commonly associated with numerous psychiatric and medical ailments and can be a manifestation of underlying psychological distress or neurological disturbances. This condition causes an increase in both mental and physical activity, leading to various behaviors, such as pacing, hand wringing, fidgeting, tapping, constantly shifting positions, etc. The agitation can manifest as rapid, purposeless movements and an inability to sit still or relax. It may also include verbal or non-verbal expressions of anxiety, like increased talking or repetitive motions. The diagnosis of psychomotor agitation is typically based on the patient's physical examination, clinical evaluation, laboratory findings, and medical history assessment. Numerous imaging studies, like magnetic resonance imaging (MRI) and computed tomography (CT) scans, may be performed to identify any structural abnormalities or brain-related problems. The healthcare provider may further use the criteria for mental health disorders in the Diagnostic and Statistical Manual of Mental Disorders (DSM-5) to determine illnesses contributing to the underlying indications.

The rising cases of psychiatric conditions, including bipolar disorder and schizophrenia, that can lead to heightened arousal and a constant state of vigilance are primarily driving the psychomotor agitation market. Besides this, the increasing prevalence of

withdrawal symptoms due to abruptly stopping or reducing the use of certain substances, such as alcohol, sedatives, benzodiazepines, etc., is creating a positive outlook for the market. Moreover, the widespread adoption of dialectical behavior therapy, owing to its various advantages, like managing intense emotions, minimizing the frequency of agitation, promoting a sense of relaxation, etc., is further bolstering the market growth. Apart from this, the inflating application of mood stabilizers, which contain valproate or carbamazepine to prevent the worsening of symptoms and enhance the quality of life in patients, is acting as another significant growth-inducing factor. Additionally, the emerging popularity of sensory integration therapy, since it involves activities that stimulate or soothe the senses, such as deep pressure touch or sensory-rich environments, to boost emotional and behavioral control, is expected to drive the psychomotor agitation market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the psychomotor agitation market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for psychomotor agitation and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the psychomotor agitation market in any manner.
