Abstracts

The 7 major recurrent glioblastoma markets are expected to exhibit a CAGR of 5.85% during 2024-2034.

The recurrent glioblastoma market has been comprehensively analyzed in IMARC's new report titled "Recurrent Glioblastoma Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Recurrent glioblastoma refers to the return or progression of glioblastoma multiforme (GBM), which is the most aggressive and common form of malignant brain tumor. It is classified as a grade IV astrocytoma and typically exhibits rapid growth and invasive behavior within the brain. The disease can occur at the original site of the tumor or in nearby areas of the brain. It can also manifest as multiple lesions in different regions of the central nervous system. The common symptoms of the ailment include persistent or worsening headaches, convulsions, loss of consciousness, abnormal sensations and movements, cognitive decline, memory problems, difficulty concentrating, changes in personality, numbness, blurred vision, hearing loss, generalized weakness, etc. The diagnosis of recurrent glioblastoma involves a combination of imaging studies, clinical evaluation, and various additional procedures. The healthcare provider will initially perform a physical examination to assess the neurological function and overall health of the patient. Several diagnostic techniques, such as magnetic resonance imaging and positron emission tomography scans, are also utilized to determine the extent and location of the disease.

The increasing incidence of incomplete surgical resection, causing the small cancerous cells to regrow and multiply, is primarily driving the recurrent glioblastoma market. In addition to this, the rising prevalence of genetic mutations and alterations that lead to

treatment resistance as well as contribute to the aggressive nature of tumors is also creating a positive outlook for the market. Moreover, the widespread adoption of molecularly targeted drugs, like bevacizumab, since they block specific signaling pathways involved in the proliferation of unhealthy tissues and the formation of new blood vessels, is further bolstering the market growth. Apart from this, the escalating application of tumor treating field therapy, which uses a device to emit alternating electric fields to disrupt cell division and limit disease progression, is acting as another significant growth-inducing factor. Additionally, the emerging popularity of gene therapy for the treatment of the ailment, owing to its several associated benefits, such as enhanced sensitivity to regimens, increased tumor suppression, and long-term therapeutic effects, is expected to drive the recurrent glioblastoma market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the recurrent glioblastoma market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for recurrent glioblastoma and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the recurrent glioblastoma market in any manner.
