Saccharin is one of the oldest artificial, non-nutritive sweeteners, first discovered in 1878. It has no caloric value and does not get metabolized by the body, being excreted unchanged. Saccharin is also better for oral health as compared to table sugar since it does not promote tooth decay. Owing to its numerous advantages, saccharin is extensively used in the food and beverage industry in diet carbonated drinks and other low-calorie products. It is also finds applications in foods and pharmaceuticals where the presence of sugar can lead to spoilage.

The rising health consciousness among the consumers regarding the negative effects of sugar consumption has led to an increase in the demand for artificial sweeteners. Since saccharin is cheaper as compared to most other sweeteners, it is used extensively in its end-use sectors. The use of saccharin is also important for people who require a diet with restriction on caloric or carbohydrate intake, such as diabetics. Majority of the health practitioners also favour the use of non-caloric sweeteners like saccharin in weight reduction.
