## Abstracts

The 7 major soft tissue neoplasms markets are expected to exhibit a CAGR of 6.07% during 2024-2034.

The soft tissue neoplasms market has been comprehensively analyzed in IMARC's new report titled "Soft Tissue Neoplasms Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Soft tissue neoplasms are a group of cancerous or non-cancerous tumors that develop in the soft tissues of the body. Soft tissues refer to the connective cells that support and surround organs, muscles, blood vessels, nerves, as well as several other structures. The tumors can arise from different types of cells found in the soft tissues and exhibit a wide range of behavior, from slow-growing and localized to aggressive and metastatic. Some common signs and symptoms associated with this ailment include a palpable mass or lump, pain or discomfort in the affected area, swelling, limited range of motion, numbness, tingling, weakness, fatigue, unexplained weight loss, ulceration, skin discoloration, etc. The diagnosis of soft tissue neoplasms typically involves a combination of clinical assessment, medical history review, and pathological analysis. Various imaging techniques, such as X-rays, magnetic resonance imaging, positron emission tomography scans, etc., can be used to visualize the tumor and identify its characteristic findings. The healthcare provider may further perform a tissue biopsy to confirm the diagnosis among patients.

The increasing cases of genetic conditions, which can result in the production of abnormal fusion genes and defective proteins, are primarily driving the soft tissue neoplasms market. In addition to this, the rising prevalence of trauma or injury to the soft tissues that can lead to cellular damage and inflammation is also creating a positive

outlook for the market. Moreover, the widespread adoption of high-energy radiation therapy to provide local tumor control by directly targeting unhealthy tissues is further bolstering the market growth. Apart from this, the escalating application of immunotherapy drugs, since they can stimulate the body's defense system to recognize and attack cancerous cells, is acting as another significant growth-inducing factor. Additionally, the emerging popularity of minimally invasive methods, including cryoablation techniques, owing to their various benefits, like less postoperative pain, fewer wound-related issues, and a shorter hospital stay, is also augmenting the market growth. Furthermore, the inflating utilization of embolization, which involves injecting small particles or beads into the blood vessels feeding the tumors, causing them to shrink, is expected to drive the soft tissue neoplasms market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the soft tissue neoplasms market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for soft tissue neoplasms and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the soft tissue neoplasms market in any manner.
