Abstracts

The global tissue diagnostics market size reached US\$ 5.5 Billion in 2023. Looking forward, IMARC Group expects the market to reach US\$ 9.4 Billion by 2032, exhibiting a growth rate (CAGR) of 5.9% during 2024-2032.

Tissue diagnostics include the analysis and testing of specific tissue samples by capturing the biological context of diseases. They are used to detect certain medical conditions like cancer and inflammatory disorders and reveal the exact type and degree of malignancy which assists in identifying potential causes and treatment options. Tissue diagnostics are highly accurate, inexpensive and can be carried out by different techniques like core and open biopsy. Nowadays, advanced technologies like immunohistochemistry (IHC), in situ hybridization (ISH), digital pathology and special staining are also being employed for performing these diagnoses.

Owing to the declining fertility rates and increased life expectancy, the overall share of

the geriatric population is currently experiencing steady growth worldwide. This is a crucial factor contributing to the market growth as older adults are more susceptible to chronic diseases and thus require frequent check-ups and diagnoses. Apart from this, altering food patterns, rising alcohol consumption and reduced physical activities among individuals have led to a rise in the incidences of several lifestyle diseases. In addition to this, the rising prevalence of various types of cancers among all age groups has also led to a surge in demand for these diagnostic services.
