Abstracts

The global traditional wound management market size reached US\$ 5.7 Billion in 2023. Looking forward, IMARC Group expects the market to reach US\$ 8.0 Billion by 2032, exhibiting a growth rate (CAGR) of 3.67% during 2024-2032. The rising prevalence of chronic and acute wounds, the increasing number of surgical procedures, escalating incidences of fatal road accidents, and ongoing improvements in healthcare infrastructure represent some of the key factors driving the market.

Traditional wound management refers to the use of various wound care products, such as clinical dressings, cotton pads, and gauzes, to clean the wound, promote faster healing, and stop bleeding. It aids in absorbing wound fluids, managing and preventing infections, controlling mechanical influences, and improving collagen maturation. It also assists in protecting the wound from contamination and is generally preferred for acute and chronic wounds with mild exudate levels and employed as primary or secondary dressings. It is widely used to manage a range of chronic wounds, such as surgical incisions, diabetic foot ulcers, pressure ulcers, venous leg ulcers, and arterial ulcers. As a result, traditional wound management finds extensive applications in healthcare settings for treating burns, trauma, injuries, and surgical wounds across the globe.

Traditional Wound Management Market Trends:

The rising instances of acute wounds and minor injuries represent one of the key factors supporting the market growth. Moreover, the increasing number of surgical procedures across the globe has generated the need for traditional wound management products to

prevent surgical-site infections (SSIs), improve treatment outcomes, enhance patient care, and reduce the duration of hospital stays. This can be attributed to the high prevalence of chronic diseases, such as urological disorders, cancer, cardiovascular diseases (CVDs), neurovascular conditions, obesity, and diabetes, due to smoking habits, sedentary lifestyles, and excessive alcohol consumption. Besides this, a surge in the establishment of ambulatory surgical centers (ASCs) and the escalating incidences of fatal road accidents have catalyzed product demand. In addition, the rising adoption of advanced wound care practices in ambulatory and outpatient centers is augmenting the market growth. In line with this, the widespread availability of favorable reimbursement policies and heavy investments by governments of various countries in improving healthcare infrastructure has propelled market growth. Furthermore, ongoing product innovations by key players, such as the launch of spray and smart bandages, new topical ointments, and design variations in adhesive bandages, are driving the market toward growth. Other factors, including the expanding geriatric population, increasing adoption of minimally invasive (MI) cosmetic procedures, emerging home healthcare trends, inflating consumer healthcare spending, and extensive research and development (R&D) activities, are also anticipated to provide a positive thrust to the market growth.

Key Market Segmentation:

IMARC Group provides an analysis of the key trends in each segment of the global traditional wound management market, along with forecasts at the global, regional, and country levels from 2024-2032. Our report has categorized the market based on product, application, and end user.
