The United States circuit breaker market size reached US\$ 2.4 Billion in 2023. Looking forward, IMARC Group expects the market to reach US\$ 3.8 Billion by 2032, exhibiting a growth rate (CAGR) of 5.2% during 2024-2032.

A circuit breaker is an electrical switch that can be automatically operated and is designed to protect an electrical circuit from damage caused by an excess current from an overload or short circuit. It interrupts the current flow after a fault is detected. Circuit breakers are made in different sizes, from small devices that protect low-current circuits up to large switchgears, designed to protect high-voltage circuits. Circuit breakers are mainly classified based on rated voltages. Circuit breakers below 1000V are known as low-voltage circuit breakers, whereas, those above 1000V are called high-voltage circuit breakers.

The demand for circuit breakers in the US is currently being driven by several factors. Circuit breakers protect an electrical circuit from damage caused by excessive current from an overload or short circuit. Its basic function is to interrupt current flow when fluctuations are detected. It is effective against low, medium and high voltage fluctuations. Moreover, Circuit breakers are designed in such a way that they are effective in detecting high-voltage fluctuations, which is the major advantage of the

device against fuses. Fuses can only work at low-voltages. As a result, circuit breakers are being widely used in large residential and commercial building projects, locomotive and transportation industries, etc. Additionally, circuit breakers are easier to reset as they do not involve touching the live parts of the device. In addition, no cost is associated with resetting circuit breakers unlike the cost of replacing fuses. Other factors which are driving the demand of circuit breakers in the US include growing demand for electricity, increasing technological advancements, high demand for non-conventional energy sources, etc.
