Abstracts

The 7 major Wet Age-Related Macular Degeneration (Wet AMD) markets reached a value of US\$ 8,997.9 Million in 2023. Looking forward, IMARC Group expects the 7MM to reach US\$ 16,864.9 Million by 2034, exhibiting a growth rate (CAGR) of 5.9% during 2024-2034.

Wet Age-Related Macular Degeneration (Wet AMD) market is currently driven by factors such as a rising patient pool, improving diagnosis and drug treatment rates, an increase in the ageing population and improving efficacy of current and emerging therapies, etc. Wet Age-Related Macular Degeneration is an eye disease that destroys the macula, which is part of the retina at the back of the eye. Wet AMD involves the growth of abnormal blood vessels under the macula that leak blood and fluids into layers of the retina, including the macula. The symptoms of wet AMD usually start suddenly and are often severe. If a patient has wet AMD in one eye, it's extremely likely that he will also get it in the other eye. With wet AMD, leaked blood and fluids can cause scar tissue to form and damage cells in the retina, damaging the central vision. Wet AMD can cause severe vision loss but does not lead to total blindness since a patient can retain his side vision. Having wet AMD can, however, make it extremely hard for people to do their daily things and can negatively impact the quality of their life.

Although the cause of Wet Age-Related Macular Degeneration is still largely unknown, age represents an important risk factor for developing Wet AMD. The disease is most common in people over 50 and becomes even more common in their 70s and 80s. Furthermore, smoking doubles the probability of developing wet AMD. In addition to cutting off oxygen to the eyes, researchers have found that smoking may damage cells and make it more difficult for nutrients to reach the eyes through the bloodstream. Other

risk factors include gender, race, family history, heart disease, obesity etc.
