Abstracts

The agriculture sector feeds around 7.5 billion people that require proper lands and fresh water. However, with the increasing pollution, the environment is changing and resulting in damage of crops and is leading to the change in the life cycle of plants and animals. Thus, one way to address this issue of agricultural production is to use sensing technology to make intelligent farms. Advanced farming is about utilisation of right technology to improve the cultivation regardless of using chemicals. The use of advanced farming will improve monitoring of crop health and animal, quality of the feed, improvement in soil (moisture and fertility), and yield production. It also helps in reducing wastage on the field and improves the efficiency of land and the crop.

The usage of technologies improves decision making process in agriculture. Escalating the demand of the food supply chain has mandated the utilisation of the agriculture resources. With this, the regulatory bodies have also started developing rural areas by setting up new infrastructure to ensure the benefits of the development in these areas.
