Abstracts

The recent evolution of IT and cloud services as a business has changed the entire industry. Improvements in enterprise capacity and performance, container-based service, and flash storage capabilities have further improved the enterprise performance management market. There are numerous factors that redefine the enterprise performance management market. Rapid improvement in the efficiency, the introduction of cloud-based enterprise performance management solutions and services offerings, use of cloud computing, software-define networking (SDN), and virtualization mean that the organizations require new approaches to meet the demands for enterprise performance management.

With cloud computing entering the market, the opinion regarding the future of enterprise performance management has started to change. The market is sending mixed signals with the changing business landscape. Thus, the cloud-based deployment mode will have the highest growth. The cloud service providers will help enterprises of all size in understanding the changing technology and its effect on future demand. Presently, decisions regarding the use of cloud require a structured approach. Organizations need to assess the workloads and identify the applications that can be moved out of the on-premises model into the cloud. The workloads are not cloud-ready, and can be run on on-premises or moved to colocation depending upon the nature and business criticality.

The benefits of cost and efficiency of cloud computing are compelling, fostering business managers to move certain applications to the cloud keeping in mind that this move would not expose the business to risk, increased cost, and disruption. The first stage is the re-platforming of applications, for instance, transitioning them from Unix or mainframe-based architecture to an X86 architecture allowing users to move away from

physical infrastructure using virtualization technologies. This process is complex, which requires an integration with cloud partners to undertake cloud migration across heterogeneous environment.

Most of the organizations are running test for cloud computing. Few have migrated their entire infrastructure to a public or private cloud and many still require on-premises infrastructure to meet the needs of the future. Enterprise performance management on cloud has significant opportunities for organizations to save costs, and become efficient and agile by optimizing the traditional facilities. The aging infrastructure cost makes it difficult to capitalize on the transformational trends such as mobility and cloud.
