## **Abstracts**

High temperature thermoplastics are now more frequently used in the medical sector because they can survive sterilisation methods like steam autoclaving and ethylene oxide. Material failure is a main or potential reason for between thirty and forty percent of medical device recalls by the U.S. Food & Drug Administration (FDA), according to a recent report by research and development company Battelle. This is a key factor in the medical industry's preference for high temperature thermoplastics.
