Abstracts

Lead and sulfuric acid are the primary components of a lead acid battery, commonly referred to as a lead storage battery. Despite their excellent reliability, lead acid batteries only have a short lifespan. Additionally, the battery includes some hazardous substances that must be removed using specific procedures.

Both overcharging and undercharging shorten battery life since they both have negative effects. Due to their petrol equivalents, lead acid batteries have an impact on pollution levels when used. Among the top nations on the world market are China, the United Kingdom, Germany, the United States, and France. The export of lead acid batteries increased significantly in 2022 in the United Kingdom, Germany, China, and South Korea.
