Abstracts

The Asia Pacific Biosensors Market would witness market growth of 10.9% CAGR during the forecast period (2019–2025).

Biosensor operates on the principle of signal transduction. The components include a bio-recognition element, a biotransducer and an electronic system composed of a display, processor, and amplifier. The bio-recognition element, essentially a bioreceptor, is allowed to interact with a specific analyte. The transducer measures this interaction and outputs a signal. The intensity of the signal output is proportional to the concentration of the analyte. Signals are then amplified and processed by the electronic system.

The escalating prevalence of diabetes is expected to positively fuel the biosensors industry growth over the forecast period. Rising awareness about self-management of diabetes facilitates the amalgamation of advanced technology in the glucometers, thereby driving market growth. For instance, novel glucometers contain embedded microchips that enable accurate and faster detection of blood glucose levels, even at home. The growing preference for such technology and availability of variant diabetic biosensors in the market will therefore boost the global biosensors industry growth.
