Abstracts

The Asia Pacific Fabric Protection Market would witness market growth of 5.4% CAGR during the forecast period (2019-2025).

There are different fabric protection products available across the market. Within their carrying agent, the cheapest ones appear to have less active ingredient suspended, making them less effective. The product works by creating an invisible and powerful layer around each fiber to prevent soil, dust, and liquids from entering. These have an impressive repellent agent and give more time before they are absorbed into the fabric, rugs or upholstery to clean up and remove spills and dust. Fabrics protectors wear out so it is necessary to re-apply, the frequency will depend on their usage.

Fabric protection is marketed as an impermeable, foolproof, protective coating that makes the tissue unsustainable. That being said, the barrier must allow the fabric to breathe once it has been cured. It eventually means that even cold water will pass through the barrier if it is left long enough. Sadly, most people have been misled or at best misinformed about what protection of the fabric is going to be and will not do. This has contributed to the product's false expectations and thus a subsequent disappointment.
