## Abstracts

An in-memory database (IMDB, also main memory database system or MMDB or memory resident database) is a system that majorly relies on the computer's main memory to store data and is different from a database management system which uses a disk storage mechanism. Simpler internal optimization algorithms and fewer CPU instructions make main memory databases relatively faster than disk-optimized databases. The traditional storage mechanism used to manage data is disk storage. Most DBMSes transfer data from disk to memory in a cache when the data is accessed, making the process of accessing data more efficient. However, the constant data movement could lead to performance issues. Accessing data from the in-memory database eliminates the seek time when querying the data, providing faster and more predictable performance.

Based on the Data type, the In-Memory Database market is segmented into Relational, NoSql and NewSql. Based on the Processing Type, the market is segmented into Online Transaction Processing and Online Analytics Processing. The Applications highlighted in this report include Transaction, Reporting, Analytics and Others. Based on Deployment Type, the market is segmented into On-Demand and On-Premise.
