Abstracts

The Asia Pacific Male Infertility Market would witness market growth of 8.9% CAGR during the forecast period (2020-2026).

One of the key causes causing male infertility is sperm heterogeneity of DNA. Male infertility is a heterogeneous group of disorders, known causes account for only 30-50 percent, and unknown cause (idiopathic) is the rest. Infertility affects about 15 percent of people of reproductive age, and the male problem alone involves about 40 percent of the problems.

Tobacco smoke contains approximately 4,000 compounds, like alkaloids, nitrosamines, and inorganic molecules, and some of these are reactive oxygen or nitrogen species. A positive and significant association has been identified between active smoking and sperm DNA fragmentation and also axonemal damage. Smoking is often associated with a decreased sperm count. Smoking is considered to enhance spermatogenesis by increasing the production of norepinephrine, which increases the conversion of testosterone to estrogen causing decreased testosterone levels.

Sperm agglutination refers to the amount of sperm stuck together in the sample given. When evaluating a fertility test result, the percentage assigned to sperm agglutination is the percentage of sperm stuck together in the sample. For example, if the semen

sample had only half the sperm sticking together, the report would read only 50 percent sperm agglutination.

Based on Treatment, the market is segmented into Assisted Reproductive Technology & Varicocele Surgery and Medication.
