Abstracts

The Asia Pacific Thermal Scanners Market would witness market growth of 12% CAGR during the forecast period (2019-2025).

A thermal scanner is a detection device which detects non-contact infrared (heat) energy and transforms it into electrical signals. It then generates thermal images and display temperature values and can measure temperature values. The thermal scanner's task includes inflammation inducement, prompting of peripheral nerve disease, early tumor warning, testing of other extreme diseases, and efficacy monitoring.

The infrared camera is used to detect high fever for quick body temperature measurement. Not just a person, but a large number of people can be scanned. This is why it is a valuable resource for researching densely populated areas such as transportation hubs, shopping centers and factories. The thermal scanners can tell who runs a high fever or has an elevated body temperature. However, this doesn't mean that the individual has coronavirus infection. Further detection and screening systems are required.

In the technology segment, the uncooled technology sub-segment is set to witness the highest growth rate over the coming years. Uncooled technology-based thermal scanners are commonly used in various vertical settings such as aerospace & defense, industrial, commercial as well as other due to their ability to operate in any weather condition. These are also cheaper and less restrictive than cooled thermal products. In fact, their operating life is long and requires less maintenance.

Based on Type, the market is segmented into Fixed and Portable. Based on Application, the market is segmented into Thermography, Security & Surveillance, Search & Rescue and Others. Based on Wavelength, the market is segmented into Long-Wave Infrared, Medium-Wave Infrared and Short-Wave Infrared.
