Abstracts

The Asia Pacific Variable Frequency Drive (VFD) Market would witness market growth of 6.7% CAGR during the forecast period (2019-2025).

The innovation that brought back the utilization of AC motors to attention was the VFD for AC motors. The AC-induction motor can change its speed by adjusting the voltage frequency used that powers it. It means that if the voltage applied to an AC motor is 50 Hz (used in countries such as China); the motor would run at its rated speed. If the frequency is raised above 50 Hz, the motor runs faster than its rated speed, and if the supply voltage frequency is lesser than 50 Hz, the motor would run slower than its rated speed.

As per the variable frequency drive working principle, the electronic controller has been primarily designed to change the voltage frequency supplied to the induction motor. The key factors driving market growth of the Variable Frequency Drive (VFD) encompass the increased investment in infrastructure development as well as a higher adoption of VFDs throughout major industry verticals. In addition, growing penetration of connected devices in commercial, industrial, and residential sectors and technological advances

are expected to increase demand for variable frequency drives worldwide.

The introduction of advanced microprocessors has allowed the VFD to function as an extremely versatile system that not only controls the motor's speed, but also protects against overcurrent during ramp-up and ramp-down circumstances. In addition, new VFDs include braking methods, power boost during ramp-up, and a range of controls during ramp-down. The biggest advantage the VFD offers is that it can ensure that when it starts, the engine does not pull unnecessary current, so that the overall demand factor for the entire plant can be managed to keep the utility bill as low as possible.
