Epigenetic pathways play a key role in the growth and function of the immune system. A growing body of research has been released over the past century attempting to clarify the correlation between epigenetic modifications and the growth of autoimmune disorders. Epigenetic changes like histone modifications, DNA methylation, and non-coding RNAs, are primarily engaged in the pathogenesis of autoimmune diseases by controlling gene expression. Significant epigenetic changes have occurred during the growth of the most common human autoimmune diseases. These changes include systemic lupus erythematosus (SLE), systemic sclerosis (SSc), rheumatoid arthritis (RA), Sjogren's syndrome (SS), autoimmune thyroid illnesses (AITD), and type 1 diabetes (T1D). These targeted at offering fresh insights into the pathogenesis of autoimmune diseases and the chance of developing new therapeutic strategies that target the epigenome.
