A dental turbine is an example of a rotary instrument that is mainly driven by air compression. It is operated directly through the dental unit's called hose by a coupling. Among all the rotary equipment, the dental turbine has the highest speed but has the lowest torque. It is recommended for those operations that need more resistance to the treatment, for example, it is used to remove hard tissues from the tooth-like enamel or prosthesis material.

An air turbine is a highly valued dental abrasive device. It rotates at a high speed, and it has become an essential device for the treatment of dental problems. Subsequently to its development, many research studies have been done to measure and appraise rotation performance and also to measure and assess the noise. An air turbine handpiece mainly uses compressed air as the driving force. Whereas an electric handpiece turbine uses a motor as the driving force.

The dental turbines have become a dynamic part of clinical procedures for almost every dental operation. With the increasing scope of dental procedures, as well as the necessity and demand for more accurate and efficient devices in dentistry, advancements in dental turbine technologies will contribute a substantial part to the field of dentistry. The high-speed handpiece turbines are adaptable instruments that are used by clinicians of all fields of dentistry. It is vital for clinicians to understand the working principle and use of different types of high-speed handpieces turbines available in the. The centers for disease control and prevention have also issued guidelines time

in order to make them aware of the sterilization of high-speed dental turbines.
