## Abstracts

The Europe Digital Holography Market would witness market growth of 19.4% CAGR during the forecast period (2019-2025).

Digital holography is an interferometry imaging technique and can be used for simultaneous imaging of multidimensional artifacts or items. The process involves multiple light waves created by dispersing a laser beam (through a beam splitter) that are used to illuminate the target and to generate its image by using the diffraction principle. This image is obtained by combining or interfering coherent reference waves with waves generated from a sample or object that needs to be imaged. The effect of these interfered waves is captured through a video camera and then transmitted to a 3D reconstruction computer. The methodology is widely applied in the fields of medical science, advertising, engineering, education, art, marketing, design, etc.

The retail sector is the biggest consumer of digital holography. Mannequins and humans are slowly being replaced as holograms could be used to greet shoppers and help them find their way through the shop and product range. Holograms are anticipated to be a cost-effective solution with technological innovations. Brick and mortar stores can compete with online giants to some degree by using holograms. One reason why holographic displays are popular with retailers is that they last a long time and can be used extensively during their tenure.
