Abstracts

The Europe Insulin Storage Devices Market would witness market growth of 8.5% CAGR during the forecast period (2020-2026).

Recent advancements have helped some patients to achieve better glycaemic control and lower hypoglycemia frequency, which is a combination that allows long-term and short-term complications to be potentially reduced. Nonetheless, with advances in both the quality and number of current technologies, clinicians are challenged to stay up-to-date and prescribe the right system that fits the specific needs and lifestyle of each patient. Providers need to be aware of and appreciate all the treatment options currently available to help patients make informed decisions about which services they should be using.

The goal of these devices and systems is to improve the care and management of diabetes in patients and to help improve the quality of life by lightening the burden of a disease that has required such intensive attention to daily care. Nevertheless, patient motivation is still needed to achieve optimal results from new technologies.

Healthcare provider education teams are also needed to encourage standardized methodologies for data review and device adjustment. Patients are empowered with the tools to maximize self-care and collaboration with their healthcare providers more than ever before. Although much work remains to be done, the last decade of advances in technology has brought us to the threshold of fully closed-loop systems and lower disease burden.
