Abstracts

The Europe Intra-gastric Balloon Market would witness market growth of 12% CAGR during the forecast period (2020-2026).

The cost-effectiveness and safety of intra-gastric balloons would play an important role in market growth. The treatments for intra-gastric balloon implantation are safer and lower-cost alternatives to bariatric surgery, which is an invasive weight loss procedure that causes multiple risks after surgery. The cost of these procedures is also considerably higher than the intra-gastric balloons plantation. Therefore, non-surgical and less-invasive weight loss procedures such as intra-gastric balloon implantation are becoming increasingly common.

Vendors' growing concentration on technical developments, which is one of the key intra-gastric balloon industry trends, will also drive market growth. Different leading vendors concentrate on improving the capabilities and performance of intra-gastric balloon devices. The manufacturers also focus on balloon volume changes and longer implantation time. Minimally-invasive procedures are required for the implantation of the intra-gastric balloon, which can be conveniently carried out in an ambulatory environment. A single endoscopic procedure can be used to position an intra-gastric balloon, and it is easily reversible.

In 2018, France's intra-gastric balloons market recorded a substantial market share due to increased demand for weight-loss procedures. According to the OECD, one in ten people is obese and in France, 40 percent is overweight. Strong demand for weight-loss

strategies as a result of rising obesity prevalence would stimulate potential business growth.
