## Abstracts

The Europe Liver Disease Diagnostics Market would witness market growth of 6.1% CAGR during the forecast period (2020-2026).

Growing incidences of obesity, metabolic syndrome, diabetes, and cardiovascular diseases that contribute to liver disease are another significant factor that fuels the growth of the liver disease treatment market. In addition, an increase in the incidence of liver disease due to the side effects of other medications such as acetaminophen and poor hygienic and sanitation conditions is projected to drive the demand in the coming years.

Liver disease in the United Kingdom has increased dramatically, particularly in people under 65 years of age — a marked contrast to all other major causes of death that have decreased in younger age groups. The epidemic was caused by alcohol, obesity and hepatitis C. LFTs are usually abnormal due to a number of causes, such as drinking too much, fatty liver due to obesity, infections, rare liver diseases, and certain cancers — but they may be a symptom of potentially fatal liver disease.

The liver is the body's factory, producing vital proteins and breaking down or excreting waste products. Liver disease is usually a silent illness in its early stages. Liver function tests (LFTs) are commonly available blood tests associated with liver damage, so early detection of liver diseases would be possible. Millions of these tests are carried out every year in the United Kingdom by doctors and nurses for a variety of symptoms and conditions ranging from tiredness, yellowing of the skin (in white people) to the whiteness of the eyes due to jaundice.
