The Global Pupillometer Market size is expected to reach \$560.5 Million by 2026, rising at a market growth of 9.2% CAGR during the forecast period. Pupillometer is a combined name for two devices. One that is in ophthalmology in which through visual stimuli distance between pupils is measured and another device is used to measure the light reflex of the pupil. An automated pupillometer is a handheld and portable device which is reliable and they are used to measure the size of the pupil, their symmetry, and reactivity of the pupillary light reflex.

Pupil dilation offers clues that are helpful in understanding the lives of people who have neurological disorders. The results of Pupillometry is beneficial in designing physiological treatment. The pupillometer results are a very effective option to decide the treatment for an individual suffering from a mental disorder. This ultimately improves the results of the diagnosis, thus, ensure an increased rate of recovery. Moreover, pupillometry can be combined with other processes that will improve the diagnosis of neurological disease. Brain-computer Interface (BCI), if used along with pupil dilation study then it will improve the results since an additional signal is added which will be helpful to understand the brain signals.

Due to a large number of benefits associated with pupillometry, their adoption is increasing. Several critical care units including neurocritical care, cardiac intensive care, surgical intensive care, medical intensive care, trauma, pediatric intensive care, and emergency department adopt pupillometers for better diagnosis. Regular pupil

evaluation has become an important protocol in critical care units. Since Pupil size and Pupillary Light Reflex (PLR) results have been used as a prognostic indicator by various medical associations and centers.

Pupillary light reflex aids in evaluating the proper functionality of the visual system. Pupillometry detects changes that occur in the response of melanopsin and cone/rod photoreceptors that helps in understanding damage on the inner and outer retina. Moreover, the measurement of the size of the pupil assists the refractive surgeons in better understanding the effects after LASIK surgery. So, the rising adoption of pupillometry in the diagnosis of ophthalmic is likely to improve segment growth during the forecast period.
