Abstracts

The Latin America, Middle East and Africa Dental Turbine Market would witness market growth of 25.5% CAGR during the forecast period (2020-2026).

A dental turbine is an engine that is used to drive several types of dental handpieces and drills. New and advanced turbines can operate at a higher speed than the original and they are made with a better quality of materials and robust ceramic bearings that make them perfect for high torque and other RPM applications. Advanced dental turbines are available as lubricated and non-lubricated turbines that can be used depending on the requirement.

In the healthcare industry, dental services are the fastest-growing market. These services mainly include diagnosis, cure, and prevention of oral cavity diseases. It comprises dental implants, endodontic, oral surgery, cosmetic dentistry, laser dentistry, smile makeover, and dentures among other services. A rise in the demand for dental services is expected to drive the demand for dental turbines during the foreseeable period.

An air turbine is a type of dental abrasive device which rotates at higher speed and it can also use compressed air as the driving force. Dental turbines are characterized by its lightweight, small size, and painless abrading owing to its high-speed rotation. But the torque is very small and creates high noise. Therefore, to increase the performance of the dental air turbine, the internal flow of the handpiece is analyzed and manipulated.
