## **Abstracts**

The Latin America, Middle East and Africa Log Management Market would witness market growth of 15% CAGR during the forecast period (2019-2025).

A log is an automatically generated and time-stamped record of events specific to a given system in a computing context. Virtually all applications and systems in the software generate log files. Effective log management is important for protection as well as compliance. A crucial component of security intelligence (SI) is tracking, recording and evaluating system incidents. For compliance, regulations like HIPPA, the Gramm-Leach-Bliley Act and the Sarbanes Oxley Act have unique audit log provisions. Technology for log-management automates most of the involved processes. For instance, an event log manager (ELM) records changes in the IT infrastructure of an organization. Such modifications are reflected in the audit trails which must be created for an audit of compliance.

The advantages of log management systems are numerous, and a good return on investment. In order to evaluate the value of an investment in this field, it helps to recognize log management systems as business intelligence. Even though a company

is focusing on information security, it can find similar features and benefits from log management systems and business intelligence systems. From data extraction, transforming and loading (ETL) to back-end business data warehouses, all traditional BI moving parts are also present in several log management systems.
