Abstracts

Application security is a process used to protect applications from external threats. Actions or measures to ensure application security are also referred to as countermeasures. Among the countermeasures, the most fundamental is the application firewall which limits the execution of files or data handling by different programs. Among the most common countermeasures on hardware level is to use a router which can prevent IP address from being visible over the World Wide Web. Various forms of countermeasures are prevalent such as conventional firewalls, encryption/decryption programs, anti-virus programs, spyware detection/removal programs and biometric authentication systems.

The enhancement of an application can be ensured by following strict guidelines. Defining the assets of an enterprise helps in planning security to a significant level. Once assets are defined, it is easy to define the roles of an application and its limitations with respect to the assets, create security profiles for all the applications, identify and prioritize potential incidence and threats and accordingly document potential incidences and also record the actions taken in each case.
