## Abstracts

The Latin America, Middle East and Africa Digital Signal Processor Market would witness market growth of 9% CAGR during the forecast period (2019-2025).

Applications-embedded digital signal processors are being used in consumer products like fax/modems, mobile phones, disk drives, printers, medical and health care devices, radio, high-definition television (HDTV), MP3 players, or digital cameras. These processors are a rather popular choice for a diverse range of consumer applications, because of their cost-effectiveness. High operating performance, small size and low cost of digital signal processing are expected to be factors that contribute to the growth of the digital signal processing industry. In addition, the increasing demand for cheaper, better-performing consumer electronics is also another factor expected to push the growth of the digital signal processor market over the forecast period.

Depending on the task and the desired result, digital signal processors are programmed to work with a wide range of mathematical digital filters and modulation technologies. Digital signal processors are experiencing technological advances in their design. Originally, traditional digital signal processors were created using a human-machine interface and a single processing core. Nevertheless, engineers are designing multi-core digital signal processors that operate in isolation and with better efficiency. Digital signal processors are favored over analog signal processors because they can perform heavy mathematical computations.
